Dawson Public Power District Transfer Switch Rebate Program

Safety for you... and our lineworkers

Dawson PPD offers a rebate to customers who have a transfer switch (also called a double-throw switch) installed so they can safely connect a generator for use during a power outage.

A transfer switch is a critical component when using a backup generator, as it prevents power from flowing back through the meter, transformer and onto the power lines. If a customer's generator sent power back onto the line, it could injure or even kill linemen who are making repairs to the line.

Incentive Amount

\$300*

for a 100 amp switch

\$500*

for a 200 amp switch

*The rebate pricing was updated on January 1, 2024. If you purchased and installed a transfer switch between April 1, 2011, and December 31, 2023, your rebate will be subject to the former rate of \$200 for a 100 amp switch or \$300 for a 200 amp switch.

Rebate Qualifications

- The rebate applies to transfer switches installed on April 1, 2011, or later.*
- The transfer switch must be installed by a licensed electrician according to the National Electrical Code.
- A manual switch must be a self-contained unit with a center "off" position and be installed near the Dawson PPD meter.
- An electronic switch that is part of an automatic power backup system does qualify.
- A mechanical interlock device installed in a service panel does not qualify.
- Meet all other requirements as defined in the Dawson PPD Standby Generator and Transfer Switch Installation Policy. The policy is located at DawsonPower.com/customerservice/rebates or copies are available by calling 308-324-2386.

After the transfer switch is installed, please contact the Dawson PPD Energy Services Specialist or your area lineworker to begin the application process.

A Dawson PPD lineworker will inspect and test the switch to ensure that it meets the above mentioned qualifications and that it is working properly.
